Section					

4 Test r	result – test lists	
4.1 Marki	ing of the control equipment	
	Inscriptions	
16.4	1. Present On rating plate of machine On/in Installation Site	
	Inscriptions legible and permanent, with the following information:	
	3. Manufacturer/supplier	
	4. Production No./Serial No.	
	5. Rated voltage, number of phases, frequency	
	6. Full-load current per incoming feeder	
	7. Short-circuit rating of the equipment	
	8. Main documentation No.	
	9. Test mark	
4.2 Incon	ning supply conductor terminations/input terminals	
5.1	Only one incoming supply conductor termination for the machine (R) (Exception possible)	
5.1	Supply conductor connected directly to the supply disconnecting and switching device (R)	
5.1	Supply conductor connected to separate supply terminals	
5.1	4. Insulated N terminal/connecting point, if N conductor present	
5.1	Terminals for the incoming supply conductor connection point clearly marked (L1, L2, L3, N, PE in accordance with EN 60445)	
5.2	6. Terminal for the external protective earthing system or external PE conductor located close to the terminals for each phase conductor	

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	N/A	YES	ON	FAULT
Section					

5.2	7. Terminal for the external PE conductor marked "PE"			
5.2 Table 1	8. Terminal for PE adequately dimensioned			
6.2.2b	Incoming supply conductor terminals and N terminal (upstream of supply disconnecting and switching device) protected against contact (IP 2X)			
6.2.2b	10.Warning sign on terminals 4			
4.3 Su	upply disconnecting device			
5.3.1 5.3.2	<ol> <li>Supply disconnecting device for each incoming feeder, in the form of:         <ul> <li>Switch-disconnector (e.g. cam-operated switch)</li> <li>Circuit-breaker</li> <li>Disconnector with auxiliary contact</li> <li>Any other switching device compliant with the IEC product standard which satisfies the requirements of EN 60947-1 and possesses a utilization category</li> <li>Plug/socket or appliance coupler for a movable machine</li> </ul> </li> </ol>			
5.3.1	2. Disconnection of the entire electrical equipment			
5.3.3	3. Disconnection of all live (non-earthed) conductors			
5.3.3	N is also disconnected     When the disconnecting device consists of a plug/socket combination			
4.3.1 Ex	cluded circuits (not switched off)			
5.3.5	Lighting (for repair and maintenance purposes only)			
	2. Sockets (for repair and maintenance purposes only)			
	3. Undervoltage protection circuits			
	Circuits for the maintenance of operation     (Measuring device, program memory)			
	5. Control circuits for interlocks			
6.2.2b	6. Protection against accidental contact (shrouding)  ≥ IP 2X or IP XXB with warning sign  on excluded circuits			
5.3.5	7. Dedicated disconnecting device (R)			
	•	 •	 	

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	N/A	YES	ON	FAULT
Section					

5.3.5	Warning sign     Or separate cable routing			
(13.2.4)	Or coloured marking in the case of interlock circuits with external power supply (recommended: orange)			
5.3.5	Reference in the maintenance handbook to non-disconnected circuits			
5.3.5 16.1	10.Warning sign on the supply disconnecting device			
7.2.8	11.Overcurrent protection provided for excluded (not switched off) circuits			
7.2.8	<ul> <li>12.No special overcurrent protection for the supply conductors (main conductor)</li> <li>Conditions: <ul> <li>Current-carrying capacity sufficient for the load, and</li> <li>Supply conductor not longer than 3 m, and</li> <li>Conductors protected against external influences by enclosure, or</li> <li>By cable duct</li> </ul> </li> </ul>			
4.3.2 Su	pply disconnecting/switching capacity			
	1 Manufacturer: - Type: - Rated voltage: - Rated current: - Switching capacity (AC 23B): - Rating of the largest 3-phase motor: - Full-load current of all loads: - Rating/current of the remaining loads: - KW/A	}	rating	of oment
5.3.3	Breaking capacity sufficient for the largest motor in the blocked state (AC23) and sum of all currents of the remaining loads			
5.3.3	The supply disconnecting and switching device is:			
5.3.3	3. Manually operable  — Handle: red (only with EMERGENCY STOP function)  — Handle: black  — Handle: grey			
5.3.3	4. Can be locked in OFF position			
5.3.3	5. Marked I (On)			
5.3.3	6. Marked 0 (Off)			

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	V/N	YES	ON	FAULT
Section					

5.3.3	7. Only for two switching positions (On/Off)			
5.3.4	8. Handle easily accessible at a height of between 0.6 m and 1.7 m (max. 1.9 m)			
	Input terminals of main switch:			
6.2.2b	9. Protected against accidental contact (IP 2X or IP XXB)			
6.2.2b	10.Warning sign on terminals			
5.3.1	11. Protective interlocking present (for dangerous situation) where two main switches are fitted			
4.3.3 F	Plugs as supply/separating devices			
5.3.3	Plug device with adequate switching capacity or additional switching device with adequate switching capacity			
13.4.5a)	Protection-level at least IP XXB			
13.4.5b)	Leading respectively delaying earthing contact			
13.4.5c)	Adequate switching capacity; where the rated current ≥ 30 A additional switching device, connection or disconnection is only possible if the switching device is in the OFF position			
13.4.5d),e)	Where the rated current > 16 A or a dangerous situation is possible: interlocking device present in order to prevent unintentional or accidental disconnection.			
13.4.5f)	Sockets/coupling continue to exhibit IP 2X or IP XXB following disconnection, with observance of the creepage and clearance distances			
4.4 F	Protection against electric shock			
4.4.1 F	Protection against direct accidental contact			
6.2				
6.2.2	1. Enclosure			
	Installation Site 1			
	Installation Site 2			
	Installation Site 3			
	Refer to the questions in Section 4.5, "Installation space"			
6.2.3	The insulation of live parts be removed only by destroying     Affected parts of the installation:			
-	•	•——	 	 ,

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	W/A	YES	ON	FAULT
Section					

3. Discharge of residual voltages: see Section 4.8, "Further requirements concerning equipment in the Installation Site"	О	О	О		
Protection through cover, distance or barriers     Affected parts of the installation:		О			
ection against indirect accidental contact

4.5	Installation Site (protection by enclosure)	
16.2.1	1. Installation Site clearly recognizable If not:	
	2. High-voltage flash symbol present (Black on yellow triangle)	
11.2.2	3. Installation Site contains no equipment (including solenoid valves) other than electrical equipment	
4.5.1	Doors/covers	
6.2.2a	With locking closure	
6.2.2a	2. With screw closure	
6.2.2a	3. Can be opened only by means of a key or tool	
6.2.2b	4. Opening without key/tool possible only following disconnection of the live parts from the system (e.g. supply disconnecting and switching device)	
6.2.2c	5. Opening without key/tool possible only when all live parts are reliably shrouded (test finger IP 2X or IP XXB)	
11.4	6. Captive closures/screws	
11.4	7. Width of door/cover < 0.9 m; opening angle at least 95° (R)	
11.4	8. Vertical hinges on doors, preferably removable (R)	
11.2.1	9. Only control and signalling devices, instruments and cooling devices (fans) on doors/shrouds	

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	A/N	YES	ON	FAULT	N/A	YES	ON	FAULT	N/A	YES	ON	FAULT

4.9.3	Without control-power transformer (Method c)		
9.1.1	One motor starter, max. 2 control devices		
9.1.3 7.2.4 7.2.10 9.4.3.1	2. Overcurrent/short-circuit protection provided and protection of the contacts assured  1 x		
	phase reversal (e.g. with Schuko-type plug) is possible (for start and stop function and possible hazard)		
4.9.4	DC control circuits	 	
9.1.1	Where DC control circuits are connected to the PE system, they are supplied from a separate winding of the AC control- power transformer (or a separate transformer for DC supply)		
4.9.5	Access to switching devices		
11.5	<ul> <li>1. Doors in aisles for access to electrical operating areas;</li> <li>At least 0.7 m wide and 2 m high</li> <li>Opening outwards</li> <li>Can be opened from inside without keys or tools</li> </ul>		
11.5	Walk-in enclosures equipped to permit flight (e.g. panic exit devices)		
11.5	3. In cases where equipment is likely to be under voltage and conductive parts exposed when the enclosures are accessed, the clear width is at least 1 m  4. In cases where such parts are located on both sides of the aisle, the clear width is at least 1.5 m		
4.10	Control functions/electronic equipment		
4.10.1	Control equipment	 	
9.1.1	Supply for electronic equipment (e.g. PLCs) by means of a transformer with separate windings or switched-mode power supply with transformer to EN 61558-2-17		
7.5	Interruption and subsequent restoration of the supply does not lead to a hazardous state		

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	N/A	YES	ON	FAULT	
Section						

9.4.3.2	Content of memories is not lost where this would lead to a hazardous state		
4.11 Sto	p functions, actions in an emergency		
4.11.1 Sto	function		
9.2.2	The machine is equipped with a stop function:     Stop Category 0 (immediate switching off of the drive energy; voltage may still be present, where it is not able to give rise to movement)     Stop Category 1 (controlled stop; Stop Category 0 following stopping)     Stop Category 2 (controlled stop; drive energy to the machine drives is retained)		
9.2.5.3	Stop function cancels start function		
	Stop function Category 0 and 1 independent of the operating mode		
	4. Stop Category 1 (controlled stop) for the following drives:		
	Stop Category 2 (controlled stop, followed by position control) for the following drives:		
9.2.5.3	Stop Categories correspond to risk assessment and functional requirements		
	Stop command effective from any operator control station,     where required by the risk assessment		
9.2.5.3 9.2.5.4.1 9.2.5.4.2 EN ISO 13849-1, 5.2.2	Manual reset of the stop function does not re-initiate motion of the machine, but merely permits restarting		

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	W/A	YES	ON	FAULT
Section					

4.11.2 Act	tions in an emergency				
9.2.5.4.2 Annex E 9.2.5.4.3 Annex E	EMERGENCY STOP present (where hazards are presented by machine movements)     Protection assured against accidental direct contact, emergency switching off not required     EMERGENCY SWITCHING OFF present (where hazards are presented by electrical energy)     Use of emergency stop in order to halt movements presenting a hazard is not necessary				
10.8.1	EMERGENCY STOP and EMERGENCY SWITCHING OFF present Confusion prevented by the following means (e.g. device in enclosure in break-glass arrangement):				
4.11.3 Eq	uipment for EMERGENCY STOP and EMERGENCY	SWI	TCHIN	IG OFF	
9.2.5.4.2	EMERGENCY STOP in the form of stop Category 0 or 1 in accordance with risk analysis				
10.7.1	In all hazard locations (workplace, control station)     Hazard location 1: Stop Category:     Hazard location 2: Stop Category:     Hazard location 3: Stop Category:     Hazard location 4: Stop Category:				
	Devices for EMERGENCY STOP/EMERGENCY SWITCHING     OFF easily accessible				
EN ISO 13850, 4.4.3	4. Mechanically self-latching				
10.7.4 10.8.4	Emergency switching off = supply disconnecting and switching device     (Not with Stop Categories 1 and 2)				
10.8.3	6. Red handle on yellow background				
10.8.2	Red pushbutton actuator, palm or mushroom actuator on yellow background				
10.7.2	Foot-operated switch without mechanical protection (for emergency stop only)				
10.7.2	Pull-wire switch     (secure against breakage, disengagement, etc.)				
9.2.5.4.1	Switching on possible only following manual resetting of all actuated control elements				

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	W/A	YES	ON	FAULT
Section					

11. Resetting does not result in start-up			
12. EMERGENCY STOP has priority in all operating modes			
13. Switching off as rapidly as possible without the generation of further hazards

	3. Supply disconnection and switching devices (5.3.2)			
	4. Switch-disconnectors			
	Removable fuse elements/isolating links in locked electrical operating areas			
	6.			
5.4	7. Devices which do not fulfil the disconnector function			
	(Only for brief inspections, adjustments, limited work on the electrical equipment and without electric shock hazard) In the form of:			
	8. Switch, lockable			
	Contactor, disconnected via the control circuit			
	10.			
4.12.2 Ope	ration – interlocks – monitoring – start			
7.5	Not a hazardous condition by restart after power failure and recurrent			
7.6 (9.3.2)	Overspeed protection with restart interlock present (if necessary)			
7.8	<ul> <li>3. If the phase sequence of the supply voltage is incorrect:</li> <li>No hazardous state possible</li> <li>No damage to the machine possible</li> <li>Protective measure:</li> </ul>			
9.3.3	4. Operation of auxiliary functions is monitored			
9.3.5	5. No time-dependent switching-off during reverse-current braking (risk of direction reversal)			
9.3.5	6. No start-up when the motor shaft is turned			
9.3.4	7. Interlock against contrary motion			
9.2.5.1	Safety functions/protective measures (interlocks) required for safe operation are present			
9.2.5.1	Measures have been taken to prevent commands emanating from different operator control stations from giving rise to a hazard			
9.2.5.2	Operational start possible only when the conditions for switching on (e.g. guarding) are met			

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	N/A	YES	ON	FAULT	
Section						

9.2.5.2	Where several operator control stations are required for initiation of starting:		
	Each control point has its own separate manual start facility		
	All start facilities are in the idle position (OFF)		
	The start-up conditions prior to the start are met		
	Simultaneous actuation (where applicable, selective by means of selector switches)		
9.2.6	12. Combined start-stop devices only for functions which do not give rise to a hazardous state		
9.2.1	13. Start function by energization (connecting voltage to "1")		
9.3.1	14. Resetting (by dropping into the closed position) of protective devices does not give rise to a hazardous start (For guards with start function, see 5.3.2.5, EN ISO 12100-2)		
	15. Start commands which give rise to a hazardous state and are not executed immediately are not stored		
9.2.5.5	16. Where machine components execute hazardous movements, monitoring is provided for example by travel limiters, motor overspeed detection, detection of mechanical overload, collision protection facilities		
9.2.5.5	17. Hazardous movements can be observed from control points		
9.2.5.5	The operator assumes the task of monitoring in the case of manually guided machines		
4.12.3 Two	-hand control		
9.2.6.2	1. Present		
ISO 13851	Type 1:     Simultaneous and sustained actuation     When one control element is released: STOP		
100 4005	Safety Performance Level: Tried-and-tested components		
ISO 13851	3. Type 2:     In addition to Type 1:     – Both control elements must be released before a new start is possible  Safety Performance Level: Single fault tolerance		
	Safety Performance Level: Single-fault tolerance		

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	W/A	YES	ON	FAULT
Section					

	T	<u> </u>		
ISO 13851	4. Type 3:			
	In addition to Type 1 and Type 2:			
	- Synchronous actuation (0.5 s)			
	Safety Performance Level:			
	A = Category 1 (tried-and-tested components)			
	B = Category 3 (single-fault tolerance) C = Category 4 (self-monitoring)			
9.2.6.2	5. Selection of the two-hand control corresponds to the risk assessment (see also: ISO 13851, "Two-hand control devices")			
4.12.4 Ena	abling control			
9.2.6.3	1. Present			
9.2.6.3	The enabling control is a manually activated interlock function of the control which:			
9.2.6.3	When <b>actuated</b> , allows operation of the machine to be initiated by a separate start control			
9.2.6.3	If not actuated, initiates a stop function and prevents initiation of machine operation			
9.2.6.3	The enabling control must be deactivated before operation of the machine can be initiated again			
9.2.6.3	4. The enabling control cannot be circumvented by simple means			
10.9	Devices for the enabling control exhibit the following characteristics:			
10.9	6. They are designed in accordance with ergonomic principles			
10.9	7. Type with 2 switch positions:			
	<ul> <li>Position 1: OFF function (not actuated)</li> </ul>			
	<ul> <li>Position 2: Enabling function (actuated)</li> </ul>			
10.9	8. Type with 3 switch positions:			
	<ul><li>Position 1: OFF function (not actuated)</li></ul>			
	<ul> <li>Position 2: Enabling function (actuated, in centre position)</li> </ul>			
	<ul> <li>Position 3: OFF function (actuated, beyond centre position)</li> </ul>			
	<ul> <li>No enabling when the switch is returned from Position 3 back to Position 2</li> </ul>

Section						

4.12.5	Wireless controls			
9.2.7.1	The power supply to the operator control station can be removed or interrupted easily			
	Unauthorized use of the operator control station is prevented by the following measures:			
	Unambiguous indication of which machine is controlled by the operator control station			
9.2.7.2	4. Precautions are taken to ensure that control commands only  – Act upon the relevant machine  – Act upon the specified function  Measure:			
	Precautions have been taken to ensure that the machine does not respond to signals other than those emanating from the operator control station  Type of precautions:			
	Where necessary, the machine can be controlled only in predefined zones or areas     Type of precautions:			
9.2.7.3	Operator control station possesses equipment for initiation of the stop function     This equipment is not marked or labelled as Emergency Stop			
	Safety-related signals and processing of control signals correspond to the risk assessment			
9.2.7.4	9. Where several operator control stations are used:  - Precautions are taken to ensure that only one operator control station is enabled at any one time  - Indication present of which operator control station controls which machine  - Indication at suitable points (risk assessment)  - Stop command effective from each operator control station where shown to be necessary by the risk assessment			
9.2.7.5	10. A change in battery voltage does not give rise to a hazardous state  Where battery-powered operator control stations may give rise to hazardous movements: warning in the event of a change in battery voltage (specified limits)  Sufficient time available for the machine to be placed in a non-hazardous state			

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	N/A	YES	ON	FAULT	
Section						

4.12.6 Ope	rating modes			
	Multiple operating modes available			
9.2.3	Operating mode (during hazardous situations) can be changed by:     Selector switch:			
9.2.3	3. Selected operating mode is unambiguously recognizable			
9.2.3	Operating mode selector switch does not initiate machine movement; separate action required			
9.2.3	Relevant safety functions/protective measures active for all operating modes			
9.2.4	6. Suspension of safety functions/safeguarding causes switching to:			
EN ISO 12100-1	- Inching mode (dead-man's circuit)			
4.11.9	– Enabling facility O			
	- Two-hand control O			
	- Portable control unit with Emergency Switching Off O			
	– Wireless control station O			
	– Reduced speed O			
	V = mm/s Form of speed reduction			
	– Reduction in power O			
	– Limitation of the range of movement O			
	and disablement of all other operating modes			
4.1	7. The design of the operating mode selector switch, form of the speed reduction, suspension/bypassing of guarding (6)			
	Correspond to the risk assessment     (see also EN ISO 13849-1)			
	8. Correspond to the requirements for this type of machine (Type C standard " "	")		

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	N/A	YES	ON	FAULT	
Section						

<b>4.12.7</b> 9.4	Control function in the event of failure
9.4.1	1. The following Performance Level in accordance with EN ISO 13849-1 (Table 2)/SIL in accordance with EN 62061 has been identified for the control system:  PL/SIL for  (Part of the machine control)  PL/SIL for  (Part of the machine control)  PL/SIL for  (Part of the machine control)  PL/SIL for  (Part of the machine control)
	2. Identification of the necessary control level by means of:  - Specified Type C standard Title.  - Risk assessment to EN ISO 13849-1  - Risk assessment to EN 62061
	3. The identified Performance Level (1) corresponds to the above requirements (2)  4. The content of memories is retained by batteries  — If so: does removal or failure of the batteries give rise to a safe state?
	5. Modification of memory content possibly only by authorized persons Protection afforded by: Key Access code Tool

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	N/A	YES	ON	FAULT	
Section						

4.12.8 I	Measures for risk reduction in the event of failure			
9.4.2.1	The measure of proven circuit techniques and components includes:     Earthed control circuit     Connection of the control devices in accordance with EN 60204-1 Section 4.3.1     Stopping by de-energization     Switching of all live conductors to the device being controlled     Use of switching devices with positive opening     Circuit design measures which reduce the possibility of faults giving rise to undesired operating states			
9.4.2.2	2. Redundancy			
9.4.2.3	<ul> <li>3. Diversity</li> <li>By combination of break and make contacts, actuated by interlocking guards</li> <li>Use of components of different type in the control circuit</li> <li>Combination of electromechanical and electronic circuits in redundant arrangements</li> <li>Combination of electrical and non-electrical (e.g. mechanical, hydraulic, pneumatic) systems</li> </ul>			
9.4.2.4	4. Function test  - Automatic by the control system, at intervals of:  - Manual during inspections or start-up testing, at intervals of:			
	5. Fault-mode behaviour is appropriate in consideration of the risk			
4.13	Control and signal devices			
10.1.2	1. Easily accessible (at a height of ≥ 0.6 m)			
10.1.2	2. Can be operated safely			
10.1.1 10.6	The danger of inadvertent actuation is low, particularly for start functions; mushroom-head actuators may be used for two-hand controls			
10.1.3	<ol> <li>Protected against external influences (corrosive fluids, vapours, gases; chips, dust, foreign objects), e.g. IP 54/IP 55; protection against accidental contact: IP XXD</li> </ol>			

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	N/A	YES	ON	FAULT

Section					

6.2.3		5. Protection by complete, permanent insulation of live parts				
6.2.6		6. Protection by placing out of reach or by obstacles				
6.4		Protection against direct accidental contact;     for indirect accidental contact, protection by PELV				
		(See Section 4.4, "Protection against electric shock")				
4.15	Elec	ctrical control devices on the machine				
4.15.1	Con	trol devices (position switches, pressure switche	s, en	code	rs)	
10.1.3 13.4.1		Have a degree of protection (IP), including cable entries which provides adequate protection against the ingress of impurities (eg wood chips, dust, foreign body)				
10.1.3		Are protected against the influence of corrosive fluids, vapours or gases				
10.1.2		Are readily accessible for maintenance purposes				
10.1.2		4. Are fitted such that they cannot be damaged by activity on the machine (such as the transport of material)				
6.3.2		5. Possess total insulation (including cable glands), or				
6.3.3 6.4		6. Are fitted with a PE connection (also applies to extra-low voltage, except PELV)  If not, affected devices:				
11.2.1		7. Plug-in control devices must be clearly assignable by unambiguous characteristics (such as shape, marking, designation)				
4.15.2	Posi	ition sensors (position switches, proximity switch	nes)			
9.3.2		Exceeding of an operating limit (position, end position) prevented by:				
		– Mechanical facility				
		Integration of position sensors into the control system				
10.1.4		Position sensors are arranged such that they cannot be damaged when overrun				

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	W/A	YES	ON	FAULT
Section					

10.1.4	3. Position sensors in circuits with safety-related control functions take the form of:			
	<ul> <li>Mechanical position switches with positive opening operation in accordance with EN 60947-5-1 (VDE 0660- 200, Section 3)</li> </ul>			
	Proximity switches with a comparable level of safety in accordance with EN 60947-5-3 (VDE 0660-214)

	Data transmission cables: 0.08 mm²		
	Control circuits, two-core, not shielded: 0.5 mm²		
	2. Within enclosures		
	Main circuits, immobile connections: 0.75 mm²		
	Control circuits: 0.2 mm²		
	Data transmission cables: 0.08 mm²		
	3. For aluminium conductors, cross-sectional area of at least 16 mm²		
	4. Frequently moved conductors are of flexible and stranded type		
4.16.6	Terminal and junction boxes		
13.5.8	Terminals in easily accessible, robust enclosures		
13.5.8 13.4.1	Appropriate degrees of protection (e.g. IP 44), including cable entries		
13.1.2	3. Cable terminations of sufficient length		
13.1.2	4. Cable entries with strain relief		
13.1.1	One terminal for each core, or specially suited terminals for multiple cores		
13.1.2	All control lines from terminal to terminal (without intermediate connection within or outside the boxes); plug-and-socket combinations are not regarded as connectors in this context		

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	N/A	YES	ON	FAULT	
Section						

		, ,	 	
13.3	7. All control lines connected by means of terminals or plug-and- socket devices (direct connection possible only on main circuits and measuring circuits)			
13.4.4	8. Intermediate terminals for the control of complex machines (e.g. for position sensors/pushbuttons) present and indicated on the circuit diagram (R)			
8.2.3	Metal enclosure, connected with good conductivity to PE			
8.2.6	10. PE connections marked ( green/yellow, PE)			
13.1.1	11. PE connections secure against working loose			
13.1.1	12. Only one PE connection on each terminal			
13.2.2	13. PE: green/yellow			
13.1.1	14. Terminals marked			
13.1.1	15. Terminals not obscured by cables			
13.4.7	16. Reserve cores connected to reserve terminals or isolated			
13.1.1	17. Conductor terminations fitted with cables sleeves (exceptions possible)			
13.1.3	18. Where laid together, cables are isolated for max. voltage			
13.4.2	19. Cable glands suitable for the ambient conditions			
13.4.2	20. No tensile stress caused by dead weight on hanging control stations			
4.16.7 Co	onnectors, requirements do not apply to bus syster	ns		
13.4.5	Supply side on the protected sockets			
13.4.5 b) + 8.2.4	PE connection (pin) early-make at insertion and late-break at withdrawal (exception for example for connectors to EN 60204-1 Section 15.4.5)			
13.4.5 g)	3. Metal enclosure connected to PE (not on PELV)			
13.4.5 a) +	4. Contact with live parts not possible during insertion or withdrawal			
13.4.5 +	Latching connectors (in order to prevent inadvertent disconnection):			
d)	With rated currents of over 16 A			
e)	When disconnection may give rise to a hazard			
h)	When not intended for disconnection under load; clear marking also necessary			
			 -	

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	W/A	YES	ON	FAULT
Section					

13.4.5 c) +	6. Plug/socket devices which are intended for disconnection and connection under load must possess adequate load switching capacity; at 30 A and above, connection or disconnection under load must be prevented		
13.4.5 i)	7. Unambiguous marking (preferably also mechanical coding) where multiple connectors are used		
13.4.5 k)	8. No use of domestic connectors		
13.4.5 k)	9. When using EN 60309-1 plug/socket combinations in control circuits only contacts are used, which are intended for such purposes; except for RF signals that are transmitted via a power supply line		
13.4.5 f)	10. The degree of protection of parts which remain under voltage following disconnection is at least IP 2X or IP XXB; exception: PELV		
13.4.5 j)	11. Plug/socket combinations in control circuits satisfy the requirements of EN 61984		
7.2.5	12. Circuits for sockets with overcurrent protection in all live (non-earthed) connectors		
	Note: one or more of these requirements must be met		
4.17 S	Sanding lines and Slip Rings		
12.7.1	Protection against direct accidental contact assured by:		
	<ul> <li>Partial insulation of the live parts</li> </ul>		
	<ul> <li>Enclosures or shrouding with degree of protection of at least IP 2X</li> </ul>		
	Horizontal surfaces of shrouds or enclosures which are easily accessible have degree of protection of at least IP 4X		
	Protection by distance in conjunction with switching-off in an emergency situation		
	Sanding lines arranged or protected such that:		
12.7.2	5. PE leads do not carry current		
	PE leads and neutral leads have separate sanding lines and slip rings		
	7. Uninterrupted connectivity to the protection earth circuit assured by the application of suitable measures (such as doubling of current collectors, monitoring of the uninterrupted connection)		

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	A/N	YES	ON	FAULT
Section					

12.7.3	8.	Current collector for the PE lead not interchangeable with other collectors			
12.7.4	9.	Removable current collectors with switch-disconnector function have a protective earth circuit which is late-break during switching-off and restores connectivity with early-make during switching-on			
12.7.5	10.	Clearances correspond to Overvoltage Category III (see EN 60664-1)			
12.7.6	11.	Creepage distances: In exceptionally dusty, damp or corrosive environments:  - Unprotected sanding lines and slip rings possess insulators with a creepage distance of at least 60 mm  - Encapsulated sanding lines, insulated multipole sanding lines and insulated single pole sanding lines have creepage distances of at least 30 mm			
	12.	Manufacturers recommendations concerning gradual deterioration in the insulation values are observed			
12.7.7	13.	If the slip ring is arranged such that it is possible to subdivide into separate sections: The placing of adjacent sections under voltage by the current collectors is prevented			
12.7.8	14.	Sanding lines and slip rings arranged in separate groups for main and control circuits			
	15.	Sanding lines and slip rings are short-circuit proof			
	16.	<ul> <li>Where slip ring systems are located underground or underfloor:</li> <li>Removable shrouding can be removed only with the aid of tools</li> <li>Metal shrouds are conductively connected to each other and earthed</li> </ul>			
	17.	Where sanding lines are located in common metal enclosures, enclosure sections are connected conductively to each other and earthed at multiple points			
	18.	Underground and underfloor sanding lines ducts are equipped with drainage facilities			
	19.	Covers or shrouds of metal enclosures or underground ducts are earthed			
	20.	Uninterrupted connectivity to the protection earth circuit where hinges are of metal

4.21.1.2	Test :	2: Earth-fault loop impedance and suitability of the	overc	urrer	nt pro	tectiv	е
18.2.2	1.	Power supply and external PE earth securely connected (visual inspection)					
18.2.2	2.	Compliance with the criteria for protection by automatic switching off of the power supply is confirmed by: Testing of the earth-fault loop impedance by: Compliance with EN 60204-1, Table 10 or Measurement in accordance with A.4, or Calculation Verification of the parameters and settings of the overcurrent protective devices					
18.2.2 Table 10	3.	Earth-fault loop impedance – EN 60204-1, Table 10:  Table 10 lists examples of maximum cable/wire lengths between each protective device and its load.  Requirements concerning the earth-fault loop impedance can be considered met when the maximum lengths stated in Table 10 are not exceeded and the assumptions stated there are considered.  Deviation from these assumptions may necessitate complete calculation or measurement of the earth-fault loop impedance  Circuits affected are:					
18.2.2 Annex A.4.2	4.	Earth-fault loop impedance – <u>Measurement</u> :  Performance of measurement of the earth-fault loop impedance with measurement apparatus corresponding to EN 61557-3 (VDE 0413-3).  During measurement:  - The machine must be connected to a power supply corresponding to the intended installation  - The measured value of the earth-fault loop impedance must satisfy the requirements of A.2:  Z <sub>s</sub> x I <sub>a</sub> ≤ U <sub>0</sub> - Consideration must be given to the increase in conductor resistance resulting from the increased temperature caused by the fault current  - Test 1 must have been performed beforehand.  Typical measurement arrangement for measurement of the earth-fault loop impedance on a machine as shown in EN 60204-1, Fig. A.1

					J
	Maintenance handbook for skilled personnel; Community language understood by the skilled personnel				
17.8	The instruction handbook contains instructions on adjustment, maintenance and repair, specifically for equipment and circuits with a protective function				
	Emergency Switching Off/Stop category				
	<ul> <li>Moving guard</li> </ul>				
	<ul><li>Set-up mode</li></ul>				
	Manual mode				
	-				
	-				
17.2	5. If applicable, information on the physical environment (lighting, shocks, atmospheric pollutants)				
17.8	6. Maintenance handbook available				
	7. Containing measures for:				
	<ul><li>Adjustment</li></ul>				
	<ul><li>Maintenance</li></ul>				
	<ul><li>Monitoring</li></ul>				
	– Repair				
5.2 R	Requirements concerning all documentation				
17.3	Reference to the various parts of the documentation by one of the following methods:				
	Cross-reference to all other documentation concerning the electrical equipment				
	<ul> <li>Compilation of all documents with document num- ber/title in a list of drawings or documents</li> </ul>				
	Compilation of all documents on one level with document number/title in a parts list of the same				
17.3	2. Documentation in accordance with EN 61082				
	3. References in accordance with EN 61346				
	4. Manuals in accordance with EN 62079				
	5. Parts lists in accordance with EN 62027 Class B				
5.3 D	ocumentation for setup				
17.4	The installation plan contains all information required for preparatory work for erection of the machine				
	Information on the recommended location and the type and cross-section of the supply cables and wires is clearly				

indicated

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	Y/N	YES	ON		FAULT
Section						
	I				1	
	The data required for selection of the type, parameters, rated current and settings of the overcurrent protective equipment for the supply lines					
	Dimensions, purpose and arrangement of all cable ducts to be provided by the operator in the foundation are indicated					
	5. Space for extension or maintenance stated on the drawing					
	6. Interconnection diagrams/-tables available					
5.4 B	lock diagrams					
17.5	Block diagram available if applicable					
5.5 C	ircuit diagrams					
17.6	Circuit diagrams available					
	Plan for interface connections, if applicable combined with circuit diagram					
	Information on load currents, peak starting currents and permissible voltage drops					
	4. Symbols displayed in the switched off state					
	5. With all supply equipment					
	6. Parameters relating to the function of the control devices and components and which are not identifiable by their symbolic presentation are indicated on the plans close to the symbols or in a footnote					
	7. Information on programming methods, program review, work process including additional safety precautions, monitoring intervals, and frequency and form of function tests					
5.6 Ir	nformation to be provided, circuit diagrams,	part	s lis	ts		
17.2	1. Circuit diagrams					

Testing based on: EN 60204-1: 2006-06	Electrical equipment of machines	N/A	YES	ON	FAULT
Section					

2. Parts lists/component lists
For each part, the parts list contains:
– Equipment identifier
- Type designation
- Supplier/procurement source
- Characteristics
- Quantity
3. Drawings
4. Instruction/maintenance handbook
